DETAILED ACTION

Priority

1. Acknowledgment is made of applicant's claim for foreign priority based on an application filed in Taiwan on 10/25/02. It is noted, however, that applicant has not filed a certified copy of the Taiwanese application as required by 35 U.S.C. 119(b).

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

3. Claims 1 and 4 are rejected under 35 U.S.C. 102(e) as being anticipated by Azami et al. (US 2002/0158666).

As to claim 1, Azami et al. discloses in figure 6 a voltage level shifter comprising a front stage circuit (650 and 660) periodically generating a first control signal (output of 650) and a second control signal (output of 660) in response to a first input clock signal (in) and a second input clock signal (inb) complementary to the first input clock signal; a switch circuit (605-606) including two PMOS transistors (paragraph 0066 teaches the transistors in figure may be PMOS transistors) connected between a maximum voltage (VDD2) and a minimum voltage (ground) in series, wherein a third control signal is outputted from a conjunction of the two PMOS transistors, and the first and second control signals are coupled to the gate electrodes of the two

Art Unit: 2816

PMOS transistors, respectively; and a driving circuit (607-612) receiving the third control signal and outputting an output clock signal.

As to claim 4, figure 6 shows that the output clock signal has a peak-to-peak value larger than a peak-to-peak value of the input clock signal.

Allowable Subject Matter

4. Claims 2 and 3 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

5. Claims 5-10 are allowed.

Claims 2 would be and claims 5-7 are allowable because the prior art fails to teach the detail to the front stage as claimed.

Claim 3 would be and claims 8-10 are allowable because the prior art fails to teach the combination of the front stage circuit, switch circuit, and the detail of the driving circuit as claimed.
